

Did You Know That?

Vacuum Cleaner Belts:

- A. Turn the roller brush.
- B. Protects the motor like a circuit breaker does electricity. The belt will break and free motor to prevent motor burn out in case the roller brush will not turn.
- C. The average life of a belt is about 40 to 60 hours.
- D. Will lose memory and stretch out when the roller brush will not turn properly (needs to be changed).
- E. Should be put on where the roller turns toward the rear wheels (most, must be twisted then put on, can be twisted the wrong way).
